SAN DIEGO GLOBAL KNOWLEDGE UNIVERSITY

FSDI – 117 Assignment Submission Report

👨‍💼 STUDENT INFORMATION:	
👤 Student Name:	**Tim Strubell**
🏫 Course Title:	**FSDI 117 – Agile Architecture and Software Project Management**
🎓 Cohort #:	**Cohort 68**
📌 Class #:	**Class 3**
📝 Assignment #:	**Assignment 3 – How to Receive Email from My Portfolio Webpage** ⁞ STRUBELL GOODS & GEAR (*SGnG*)
📅 Submission Date:	**Oct 5, 2026**
📁 Folder Name:	***fsdi117_ch68_cl3_asgmt3_strubell***
🔗 GitHub Repo Link:	**https://github.com/TStrubell/FSDI_117_Ch68.git**

⚡ EVIDENCE OF FUNCTIONALITY ⚡

How to Receive an Email from my Portfolio Webpage

The **SGnG Contact Page** demonstrates a complete end-to-end communication workflow, beginning with the **frontend user interface** and concluding with a *successfully delivered email*. Users can access the contact form in either **Light Mode** or **Dark Mode**, and in both supported languages—**English** and **Spanish**—thanks to the project's integrated **internationalization (i18n)** and **localization (l10n)** system. This bilingual architecture ensures all labels, messages, and feedback translate consistently across the portfolio. Once a user submits the form, the backend validates the input, constructs a formatted email, and sends it using Django's ***send_mail()*** function. The following sections provide visual evidence of this full operational flow, including the frontend display, successful message confirmation, email receipt, and backend logic that powers the SGnG contact system. Full-size screenshots are located at the end of the project, after the AI Disclosure.

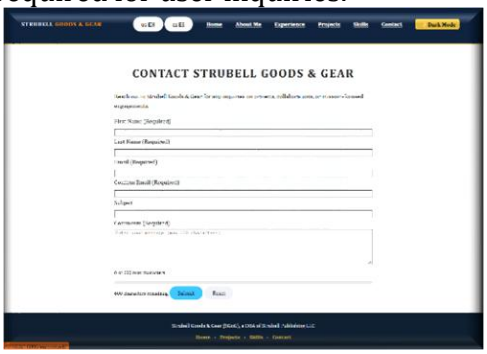

📖 SECTION 1 – FRONTEND/UI:

This section demonstrates the complete flow:

user fills the form → message sent → email received → backend logic.

A. Contact Webpage *(Browser View, Light Mode)*:

This screenshot shows the SGnG Contact Page in Light Mode as rendered in the browser. It demonstrates the complete frontend layout, including the navigation bar, language selector, dark mode toggle, and the structured contact form fields required for user inquiries.

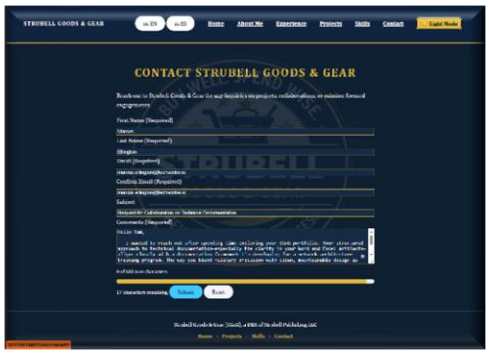

📸 Screenshot 1 — Contact Page (Browser View in Light Mode)

This view confirms that the contact form is visually accessible and professionally presented in Light Mode, providing users with a clear, intuitive interface for submitting messages to Strubell Goods & Gear.

B. Contact Webpage *(Browser View, Dark Mode)*:

This screenshot captures the SGnG Contact Page in Dark Mode, highlighting the alternative visual theme. It shows the same contact form and navigation elements rendered with the SGnG dark color palette for improved readability in low-light environments.

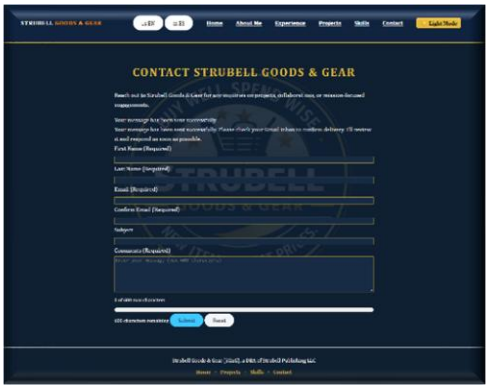

📸 Screenshot 2 — Contact Page (Browser View in Dark Mode)

This view demonstrates that the contact page maintains full functionality and visual consistency in Dark Mode, ensuring a cohesive user experience across both themes.

C. SGnG Contact Page Message Sent Successfully:

This screenshot displays the SGnG Contact Page immediately after a successful form submission. The success message confirms that the user's inquiry has been processed and that an email has been sent from the portfolio site.

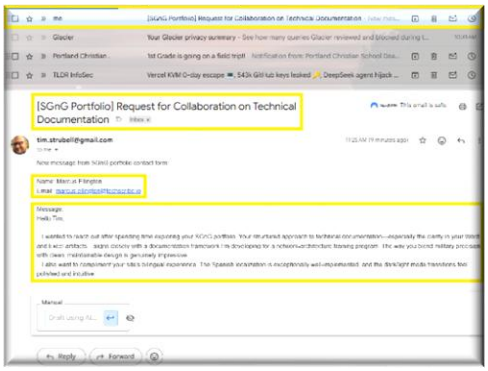

📸 Screenshot 3 — SGnG Contact Page Message Sent Successfully

This evidence verifies that the frontend correctly reflects backend operations, providing clear feedback to users when their message has been successfully transmitted.

D. Gmail Client Received SGnG Portfolio Message:

This screenshot shows the Gmail client with the message received from the SGnG Contact Page. It demonstrates that the email sent from the portfolio site arrives in the target inbox with the expected subject line and content.

📸 Screenshot 4 — Gmail Client Received SGnG Portfolio Message

This confirms end-to-end functionality: the contact form submission results in a properly formatted email delivered to the SGnG inbox, validating the integration between the web application and the email service.

🎯 SECTION 2 – BACKEND/LOGIC:

A. Backend Logic – *contact_view* and *send_mail()*:

The backend logic for the SGnG Contact Page is implemented within the ***contact_view*** function in Django's ***views.py*** file. This function handles form validation, constructs a formatted email message, and uses Django's built-in ***send_mail()*** utility to transmit user inquiries to the SGnG inbox. The screenshot below captures the complete backend workflow, including the subject line, message body, sender address, and recipient list, demonstrating how server-side logic supports the contact form's functionality.

📸 Screenshot 5 — Backend Logic Send Email SGnG Function

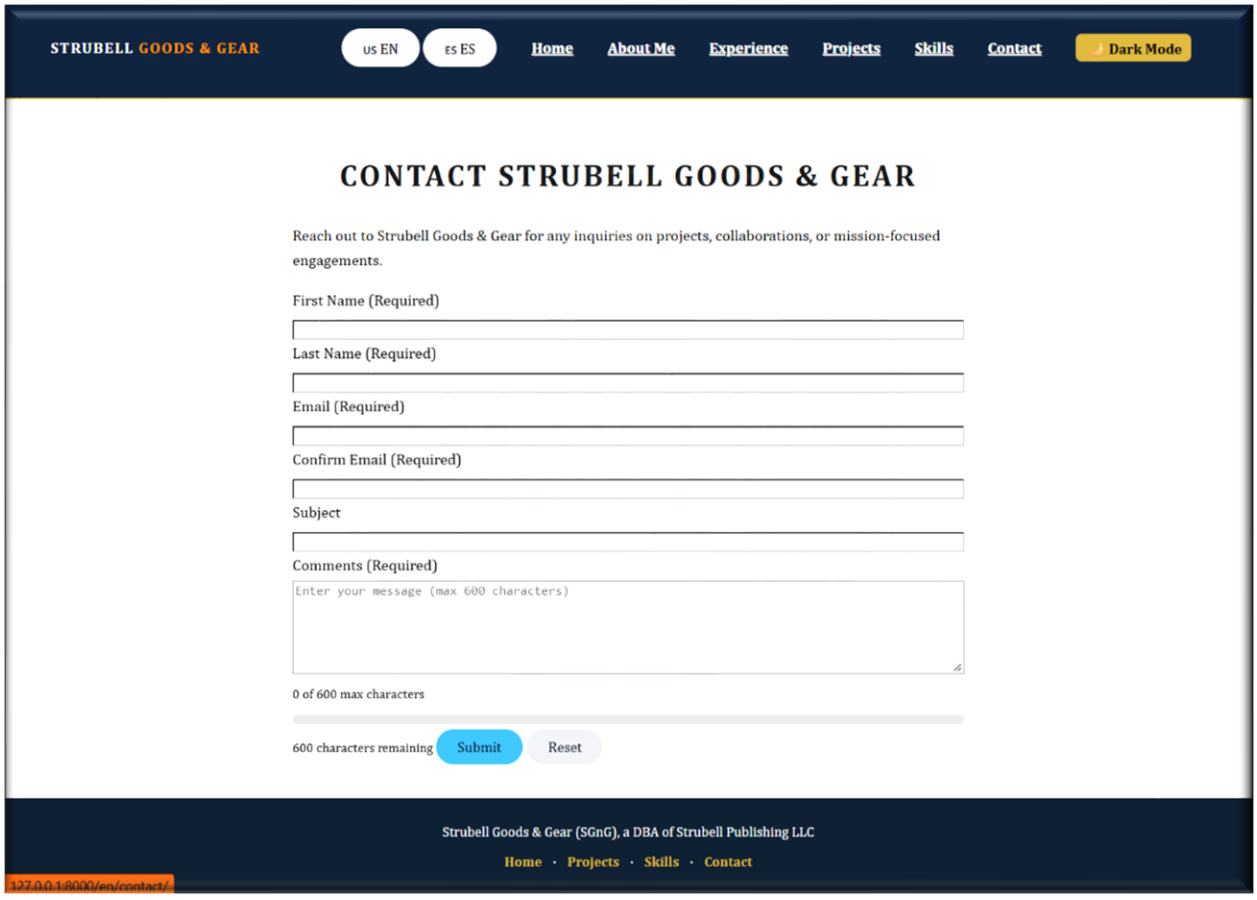

This backend implementation ensures the SGnG Contact Page operates reliably and professionally, giving users a seamless way to submit inquiries. By leveraging Django's email framework and structured form handling, the application keeps the code clean and maintainable while delivering essential communication features. The captured screenshot highlights the core backend processes that power the contact form and reflects the disciplined, organized approach used throughout the SGnG portfolio system.

SECTION 3 — AI DISCLOSURE:

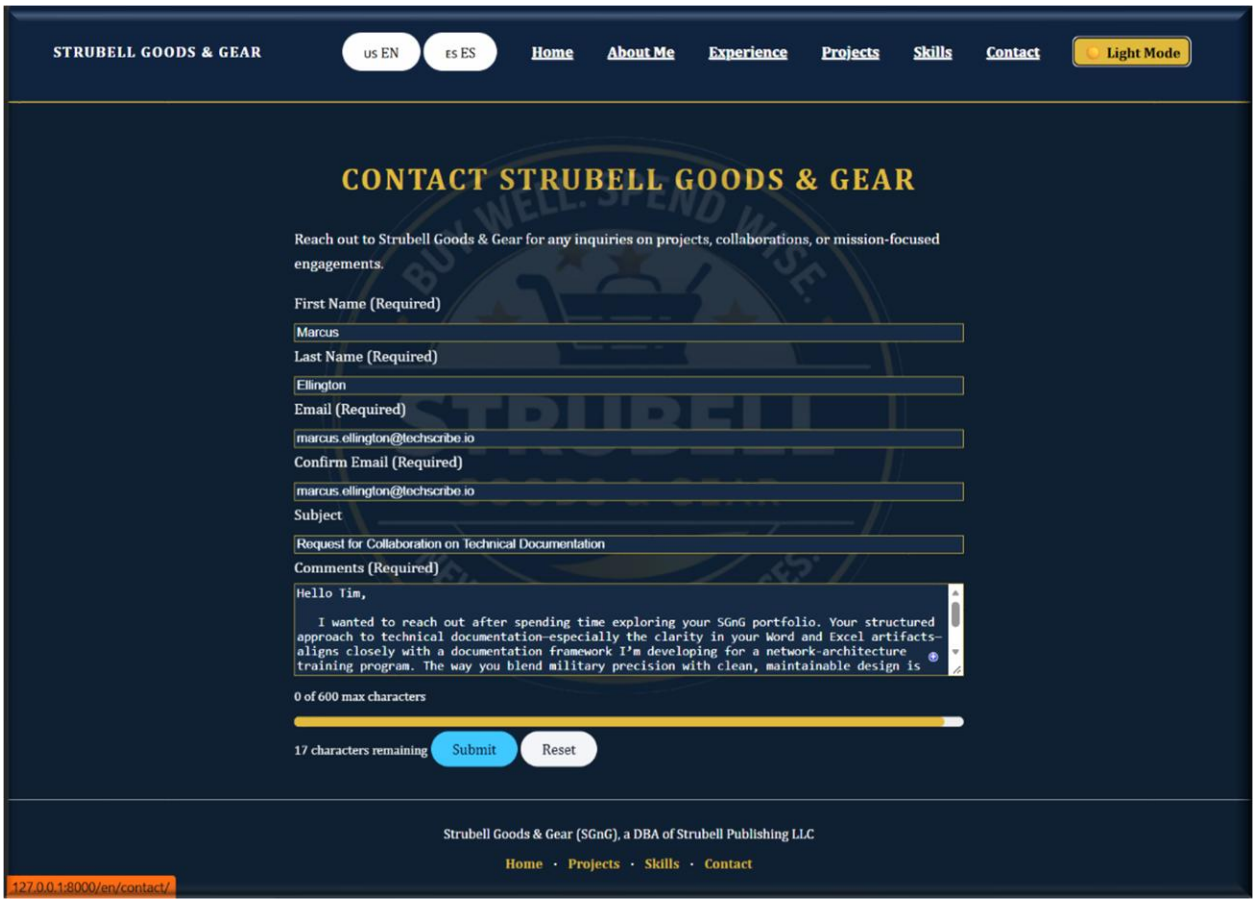

☐ I did not use AI ☒ *I used AI for help* ☐ AI generated parts of my code

I used *Microsoft Copilot* to help organize and draft the written content for this assignment. This use complies with **SDGKU's** guidelines for AI-assisted learning. **Microsoft Copilot did not generate any source code.** The ideas, interpretations, and final responses represent my own understanding and were reviewed and finalized by ***me,*** **Tim Strubell**.
